**A: Theory**

---

The algorithm used on this assignment was an enhanced version of the baseline algorithm. The enhancements are listed below:

- Considered both  $p(f|e)$  and  $p(e|f)$ . The output is the intersection of both sets.
- Applied probability smoothing for both  $p(f|e)$  and  $p(e|f)$ . Assuming we have a source vocabulary of size  $v_f$  and a target vocabulary of size  $v_e$ , the formula for calculating probabilities are smoothed as the followings:

$$P(f|e) = \frac{(count_{f,e} + \delta)}{(count_e + \delta * v_f)} \quad (1)$$

$$P(e|f) = \frac{(count_{e,f} + \delta)}{(count_f + \delta * v_e)} \quad (2)$$

Here,  $\delta$  is a very small constant. We chose it to be 0.01

---

**B: Algorithm**

---

The algorithms for the both the word alignment and decoding are shown in the next page:

**Algorithm 1** Expectation Maximization Training**Input:** Set of sentences  $F$  from source language and Set of sentences  $E$  from target language**Output:** Probability distributions  $P(f|e)$  and  $P(e|f)$  for any source word  $e$  and target word  $f$ 

```

1:  $v_f \leftarrow$  number of distinct source words
2:  $v_e \leftarrow$  number of distinct target words
3: Initialize all counts to 0
4: Initialize  $t1_{f|e} \leftarrow \frac{1}{v_f}$  and  $t2_{e|f} \leftarrow \frac{1}{v_e}$  for all possible pair  $(f, e)$ 
5: Initialize  $\delta \leftarrow 0.01$ 
6: while  $Epoch \leq MaxEpoch$  do
7:    $Epoch \leftarrow Epoch + 1$ 
8:   for each pair of sentences  $(f, e)$  do
9:     for each  $f_i$  in  $f$  do
10:       $c \leftarrow 0$  and  $z \leftarrow 0$ 
11:      for each  $e_j$  in  $e$  do
12:         $z \leftarrow z + t1_{f_i|e_j}$ 
13:      for each  $e_j$  in  $e$  do
14:         $count_{f_i,e_j} \leftarrow count_{f_i,e_j} + \frac{t1_{f_i|e_j}}{z}$  and  $count_{e_j} \leftarrow count_{e_j} + \frac{t1_{f_i|e_j}}{z}$ 
15:      for each  $e_i$  in  $e$  do
16:         $c \leftarrow 0$  and  $z \leftarrow 0$ 
17:        for each  $f_j$  in  $f$  do
18:           $z \leftarrow z + t2_{e_i|f_j}$ 
19:        for each  $f_j$  in  $f$  do
20:           $count_{e_i,f_j} \leftarrow count_{e_i,f_j} + \frac{t2_{e_i|f_j}}{z}$  and  $count_{f_j} \leftarrow count_{f_j} + \frac{t2_{e_i|f_j}}{z}$ 
21:      for each pair  $(f, e)$  in  $count_{f,e}$  do
22:         $t1_{f|e} \leftarrow \frac{(count_{f,e} + \delta)}{(count_e + \delta * v_f)}$ 
23:      for each pair  $(e, f)$  in  $count_{e,f}$  do
24:         $t2_{e|f} \leftarrow \frac{(count_{e,f} + \delta)}{(count_f + \delta * v_e)}$ 
25: return  $t1_{f|e}$  and  $t2_{e|f}$  for all  $e$  and  $f$ 

```

**Algorithm 2** Decoding**Input:** Probability distributions  $t1_{f|e}$  and  $t2_{e|f}$  for any source word  $e$  and target word  $f$ **Output:** Set of aligned word pairs  $(f_i, e_j)$ 

```

1:  $AlignedWords \leftarrow \emptyset$ 
2: for each pair of sentences  $(f, e)$  do
3:    $list_{FE} \leftarrow \emptyset$  and  $list_{EF} \leftarrow \emptyset$ 
4:   for each  $f_i$  in  $f$  do
5:      $best_j \leftarrow \operatorname{argmax}_{e_j} t1_{f_i|e_j}$ 
6:     add pair  $(f_i, e_j)$  to  $list_{FE}$ 
7:   for each  $e_i$  in  $e$  do
8:      $best_j \leftarrow \operatorname{argmax}_{f_j} t2_{e_i|f_j}$ 
9:     add pair  $(f_j, e_i)$  to  $list_{EF}$ 
10:  add  $list_{FE} \cup list_{EF}$  to  $AlignedWords$ 
11: return  $AlignedWords$ 

```
